Research Experience and Interest: My research creates mathematical and computational models connecting cognition with movements and their sensations. I create and deploy technology and in-house developed experimental assays to scale research and sample broadly across the human population. My research aims to ultimately uncovering how human autonomous intelligence spontaneously self-emerges and coexists with voluntary actions. I want to understand the synthesis of creative thoughts and problem solving using a renovated embodied cognition approach. I use the lifelong autism model and other neurodevelopmental disorders as a springboard to advance the various basic scientific aspects of this central quest of my research program. I also build translational and actionable medical solutions to help various communities. I develop and share technology to advance science dissemination and reproducibility. I also strive to educate the public to continue their trust and support of our science. Further, I develop interdisciplinary collaborative networks to produce multiple revenue streams for science and technology, and to train new generations of innovators for academia, R&D, and industry.
